A Review of HTTP/FTP Protocols

Reference:
J.F Kurose and K.W. Ross

*Computer Networking:
A Top Down Approach,*

Jim Kurose, Keith Ross
Addison-Wesley

Application layer and its protocols

- ❑ **Application layer:** The application layer is responsible for supporting network applications.
- ❑ The application layer includes many protocols, including :
 - HTTP to support the Web,
 - SMTP to support electronic mail,
 - and FTP to support file transfer.

...

Web and HTTP

First some jargons

- ❑ Web page consists of objects
- ❑ Object can be HTML file, JPEG image, Java applet, audio file,...
- ❑ Web page consists of base HTML-file which includes several referenced objects
- ❑ Each object is addressable by a URL
- ❑ Example URL:

`www.someschool.edu/someDept/pic.gif`

host name

path name

HTTP overview

HTTP: HyperText Transfer Protocol

- Web's application layer protocol
- client/server model:
 - ❖ *client*: browser
Browser is a user agent for Web. It requests, receives, "displays" Web objects
 - ❖ *server*: Web server
sends objects in response to requests

HTTP overview (continued)

Uses TCP:

1. client initiates TCP connection with the server
2. client sends a HTTP request message into the socket associated with the TCP connection
3. The HTTP server receives the request message; encapsulates the object in a HTTP response message, and sends.

4. client receives the response message.
5. The TCP connection terminates.

HTTP is "stateless"

- server maintains no information about past client requests

HTTP connections

Nonpersistent HTTP

- ❑ At most one object is sent over a TCP connection.
- ❑ HTTP/1.0 uses nonpersistent HTTP

Persistent HTTP

- ❑ Multiple objects can be sent over single TCP connection
- ❑ HTTP/1.1 uses persistent connections in default mode

Nonpersistent HTTP

Suppose user enters URL

`www.someSchool.edu/someDepartment/home.index`

(contains text,
references to 10
jpeg images)

1a. HTTP client initiates TCP connection to HTTP server (process) at `www.someSchool.edu` on port 80

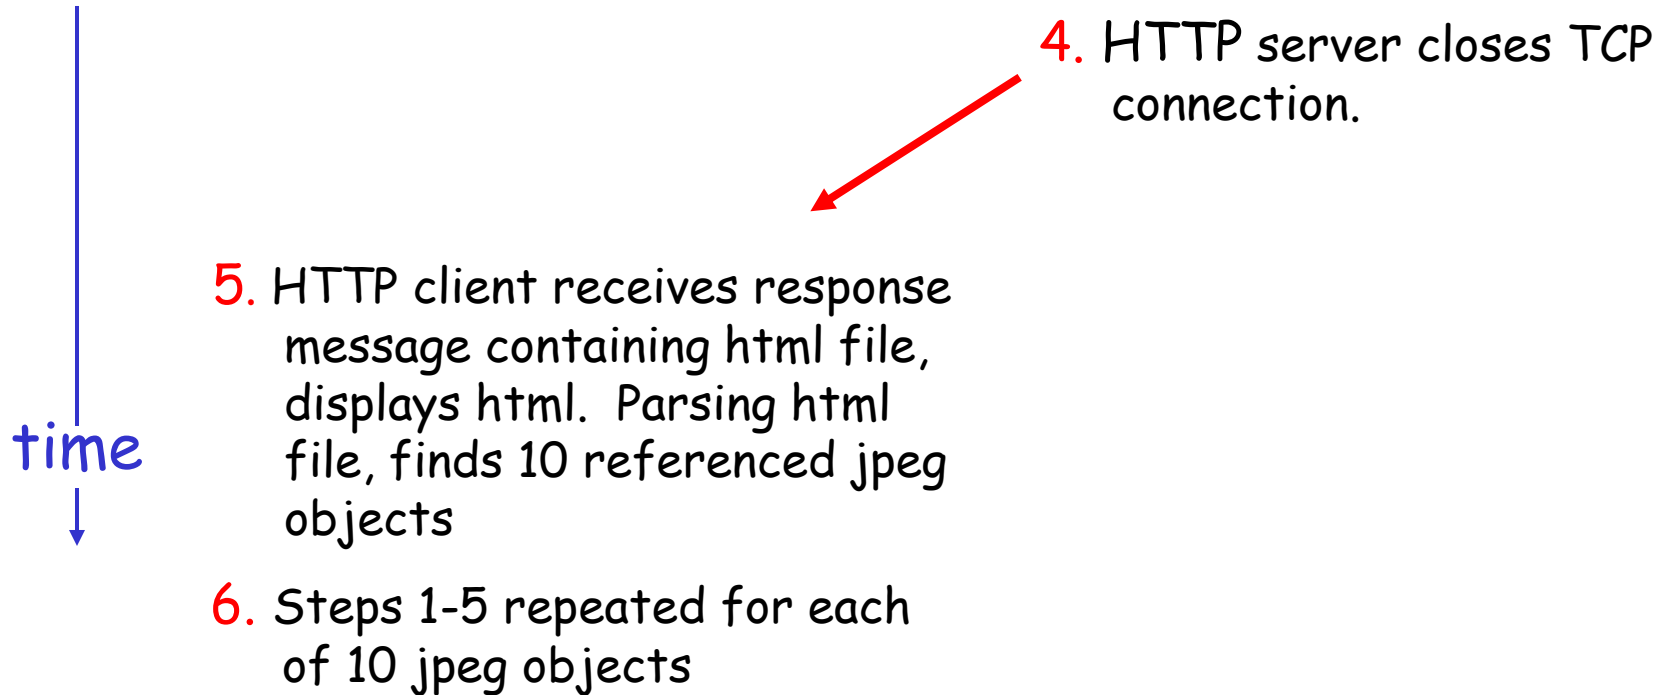

1b. HTTP server at host `www.someSchool.edu` waiting for TCP connection at port 80. "accepts" connection, notifying client

2. HTTP client sends HTTP *request message* (containing URL) into TCP connection socket. Message indicates that client wants object `someDepartment/home.index`

3. HTTP server receives request message, forms *response message* containing requested object, and sends message into its socket

time
↓

Nonpersistent HTTP (cont.)

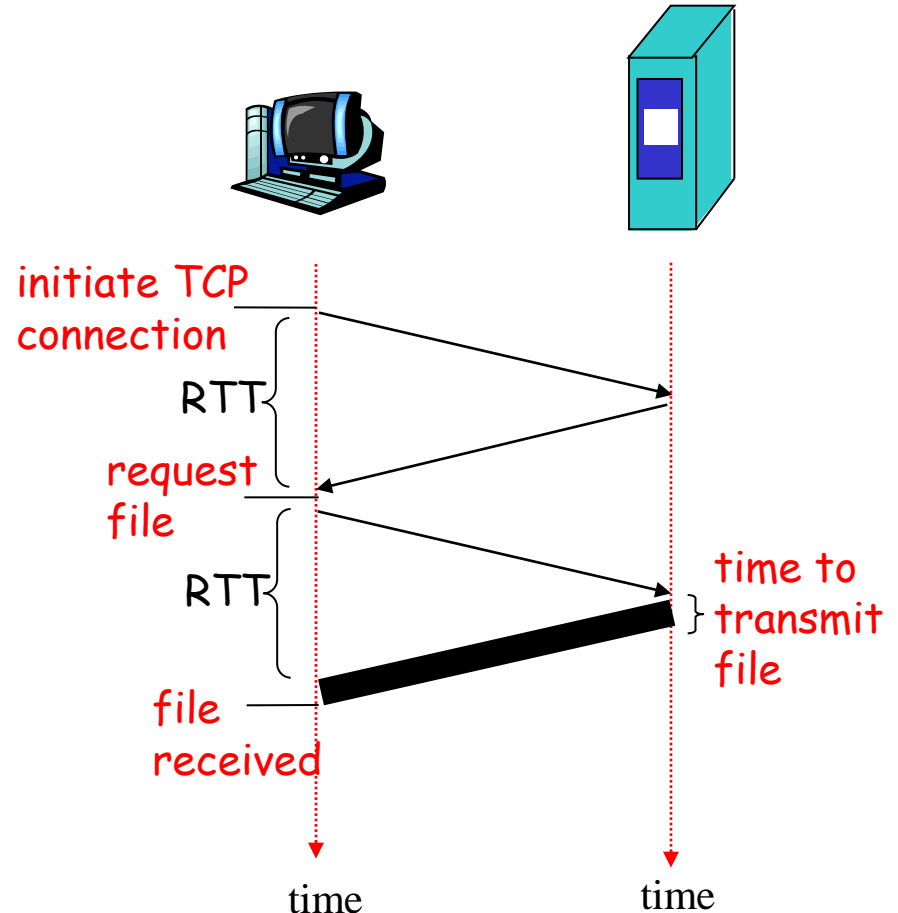

Non-Persistent HTTP: Response time

Response time:

- ❑ one RTT to initiate TCP connection
- ❑ one RTT for HTTP request and first few bytes of HTTP response to return
- ❑ file transmission time

total = 2RTT + transmit time

Persistent HTTP

Nonpersistent HTTP issues:

- ❑ requires 2 RTTs per object
- ❑ OS overhead for *each* TCP connection
- ❑ To alleviate: browsers often open parallel TCP connections

Persistent HTTP

- ❑ server leaves connection open after sending response
- ❑ subsequent HTTP messages between same client/server sent over open connection

Persistent *without* pipelining:

- ❑ client issues new request only when previous response has been received
- ❑ one RTT for each referenced object

Persistent *with* pipelining:

- ❑ default in HTTP/1.1
- ❑ client sends requests as soon as it encounters a referenced object
- ❑ as little as one RTT for all the referenced objects

HTTP request message

- two types of HTTP messages: *request, response*
- **HTTP request message:**
 - ❖ ASCII (human-readable format)

request line
(GET, POST,
HEAD commands)

header
lines

Carriage return,
line feed
indicates end
of message

```
GET /somedir/page.html HTTP/1.1
Connection: close
User-agent: Mozilla/4.0
Accept: text/html, image/gif, image/jpeg
Accept-language: fr
```

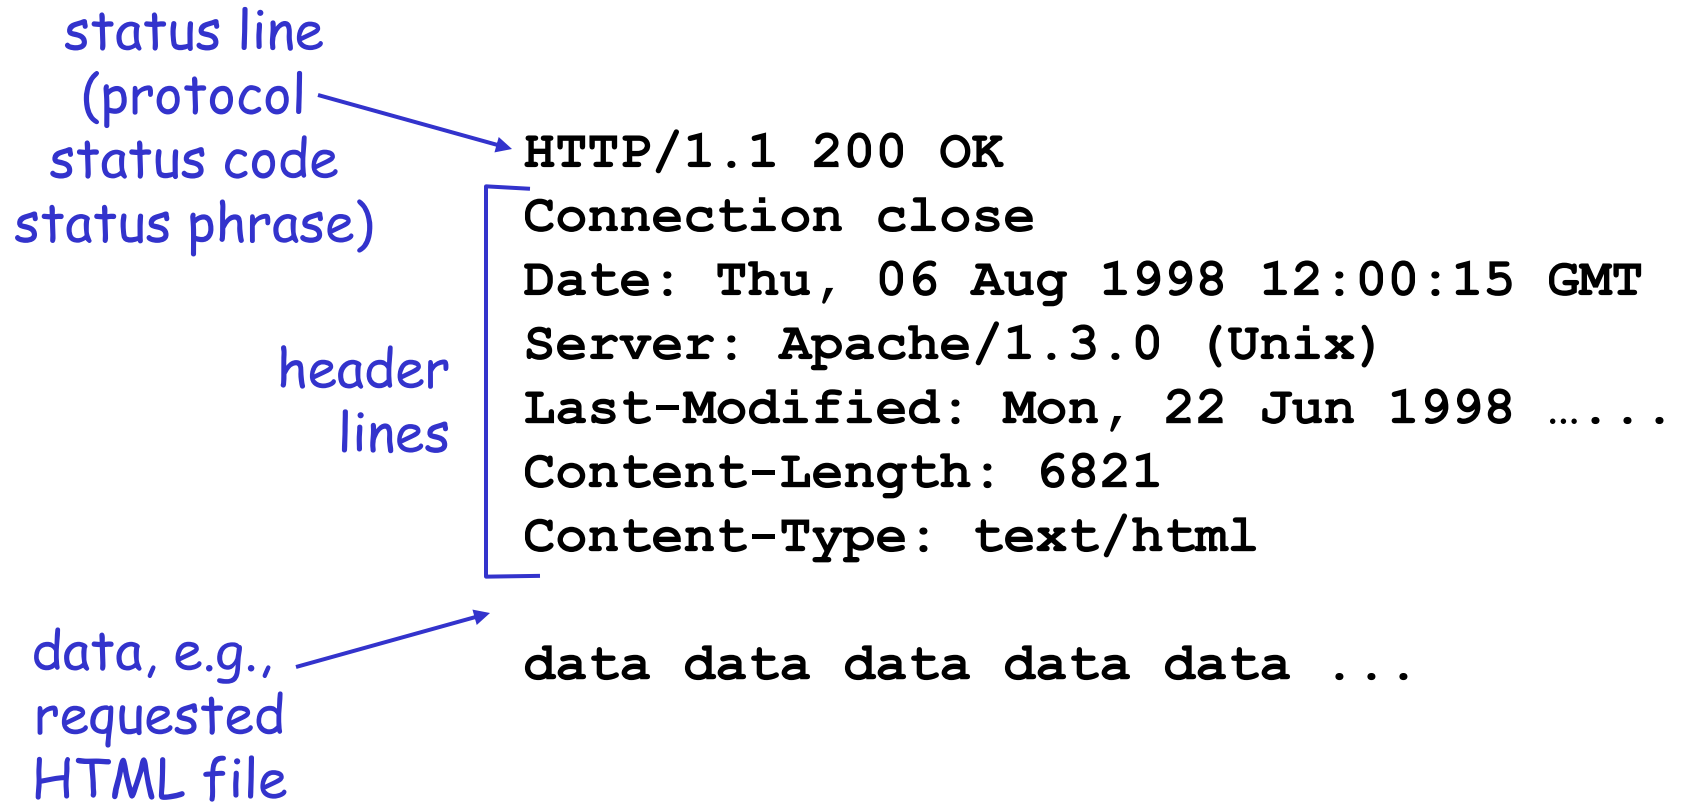

it doesn't want to use
persistent connections

(extra carriage return, line feed)

HTTP request message: general format

HTTP response message

HTTP response status codes

In first line in server->client response message.

A few sample codes:

200 OK

- ❖ request succeeded, requested object later in this message

301 Moved Permanently

- ❖ requested object moved, new location specified later in this message (Location:)

400 Bad Request

- ❖ request message not understood by server

404 Not Found

- ❖ requested document not found on this server

505 HTTP Version Not Supported

FTP: file transfer protocol

- ❑ transfer file to/from remote host
- ❑ client/server model:
 - ❖ *client*: side that initiates transfer (either to/from remote)
 - ❖ *server*: remote host

FTP: file transfer protocol

- ❑ The user first provides the hostname of the remote host→
- ❑ The FTP client establish a TCP connection with the FTP server.
- ❑ The user provides the user identification and password, which get sent over the TCP connection as part of FTP commands.
- ❑ the user copies one or more files stored in the local file system into the remote file system (or vice versa).

FTP: separate control, data connections

- ❑ FTP client contacts FTP server at port 21
- ❑ client authorized over control connection
- ❑ client browses remote directory by sending commands over control connection.
- ❑ when server receives file transfer command, server opens 2nd TCP connection (for file) to client
- ❑ after transferring one file, server closes data connection.

- ❑ server opens another TCP data connection to transfer another file.
- ❑ the control connection remains open throughout the duration of the user session, but a new data connection is created for each file

FTP commands, responses

Sample commands:

- ❑ sent as ASCII text over control channel
- ❑ USER *username*
- ❑ PASS *password*
- ❑ LIST return list of file in current directory
- ❑ RETR *filename* retrieves (gets) file
- ❑ STOR *filename* stores (puts) file onto remote host

Sample return codes

- ❑ status code and phrase (as in HTTP)
- ❑ 331 Username OK, password required
- ❑ 125 data connection already open; transfer starting
- ❑ 425 Can't open data connection
- ❑ 452 Error writing file
